It Changes the Efficacy of that Protein by Changing the Shape a Little Bit by Changing It Dramatically all of that and We Can See Back to Our Lock and Key Where if Thanks to a Mutation this Has a Slightly Different Trait It Will Fit into the Lock Slightly Less Effectively May Stay In There for a Shorter Time before Floating Off and Thus Send Less of a Message on the Other Hand if You've Got a Deletion Insertion That Dramatically Changes the Shape of this You Will Change How Well this Protein Does Its Job It Will Do Its

Job At All because It's Going To Wind Up with a Completely Different Shape and Not Fit In There
Whatsoever

And of those What You Find Is of the 60 Possible Mutations 40 of Them Will Not Cause a Change in an Amino Acid Statistically Two-Thirds of the Time There Will Not Be a Change So in Other Words if You Scatter a Whole Bunch of Mutations and You Wind Up Seeing 2 / 3 Are Neutral in Terms of Their Consequence and 1 / 3 Actually Causes a Change in the Amino Acid That's Telling You It's Happening at the Random Expected Rate of Mutations Popping Up That Are either Consequential Changing an Amino Acid or Inconsequential Just Coding for a Different Version of the Same Amino Acid Now Suppose You Find a Gene That Differs
